

Stress, Health, and Stability - Sources and Method Notes

This document lists the public research sources and federal datasets that support the Stress, Health, and Stability evidence packet. All findings come from national, reputable institutions. No private medical data or individual health records were used.

1. Financial Stress and Mental Health Sources

Key findings are based on the American Psychological Association's Stress in America reports, the Federal Reserve Survey of Household Economics and Decisionmaking, and Centers for Disease Control mental health surveillance summaries. These sources consistently show that financial worry increases anxiety, sleep problems, and emotional strain.

2. Physical Health Impact Sources

Physical health findings are supported by CDC Behavioral Risk Factor Surveillance System data, National Institutes of Health research on chronic stress, and American Medical Association reports on cost-related delays in care. These sources show how long-term stress affects heart health, immune function, and medical decision-making.

3. Family Stability and Childhood Development Sources

Research comes from the U.S. Census Household Pulse Survey, Pew Research Center parenting studies, and Harvard Center on the Developing Child reports. These sources explain how financial strain influences family conflict, parental burnout, and children's ability to learn and participate in school activities.

4. Long-Term Opportunity and Mobility Sources

Support for long-term instability impacts is drawn from Federal Reserve reports on U.S. household well-being, the Georgetown Center on Education and the Workforce, and Brookings Institution research on economic mobility. These show how financial stress reduces long-term opportunity and increases long-term risk.

5. Verification Note

All sources listed here are public, accessible, and based on large-scale research. They provide broad national trends, not individual health data. This packet summarizes themes supported by these public findings.
