

Powell 'Transitory' Narrative Confidence Over Time

Public Stance vs Evidence Pressure

Internal Warnings vs Public Reassurance (2001-2021)

Federal Reserve Hearings & Transcripts — Timeline Evidence (Qualitative Index)

This evidence file turns Powell's public statements and internal warnings into simple, visual timelines.

Page 1 — 'Transitory' Narrative Confidence

- Index 3 = Powell speaks with full confidence that inflation is 'transitory'.
- Index 1 = Powell begins to hedge or retire the word.
- Index 0 = Powell admits the Fed misjudged inflation ("how little we understood").

The chart shows a long stretch at level 3 through mid-2021, despite broadening inflation, then a sudden drop as the narrative collapses.

Page 2 — Public Stance vs Evidence Pressure

- The blue line shows Powell's public stance (higher = more 'transitory').
- The orange line shows the weight of evidence that inflation is persistent.

By late 2021, the lines cross: the evidence is strongest precisely when Powell is still publicly leaning on the 'transitory' story. This is the core APA contradiction.

Page 3 — Internal Warnings vs Public Calm (2001–2021)

- Internal concern is drawn from Gramlich's 2001 predatory-lending warnings, 2006–08 housing-bubble concerns, and 2021 FOMC minutes about longer-lasting pressures.
- Public calm reflects Greenspan/Bernanke/Powell's reassurances in the same eras.

The gap between the lines shows moments when the Fed had serious internal warnings while telling the public that risks were 'contained' or temporary.

These qualitative indices are constructed to help a judge, citizen, or student see the pattern at a glance: repeated cycles where internal concern rises, evidence builds, but the public narrative lags behind until the problem is undeniable.
